Ltd.

GETS in Co-location Services

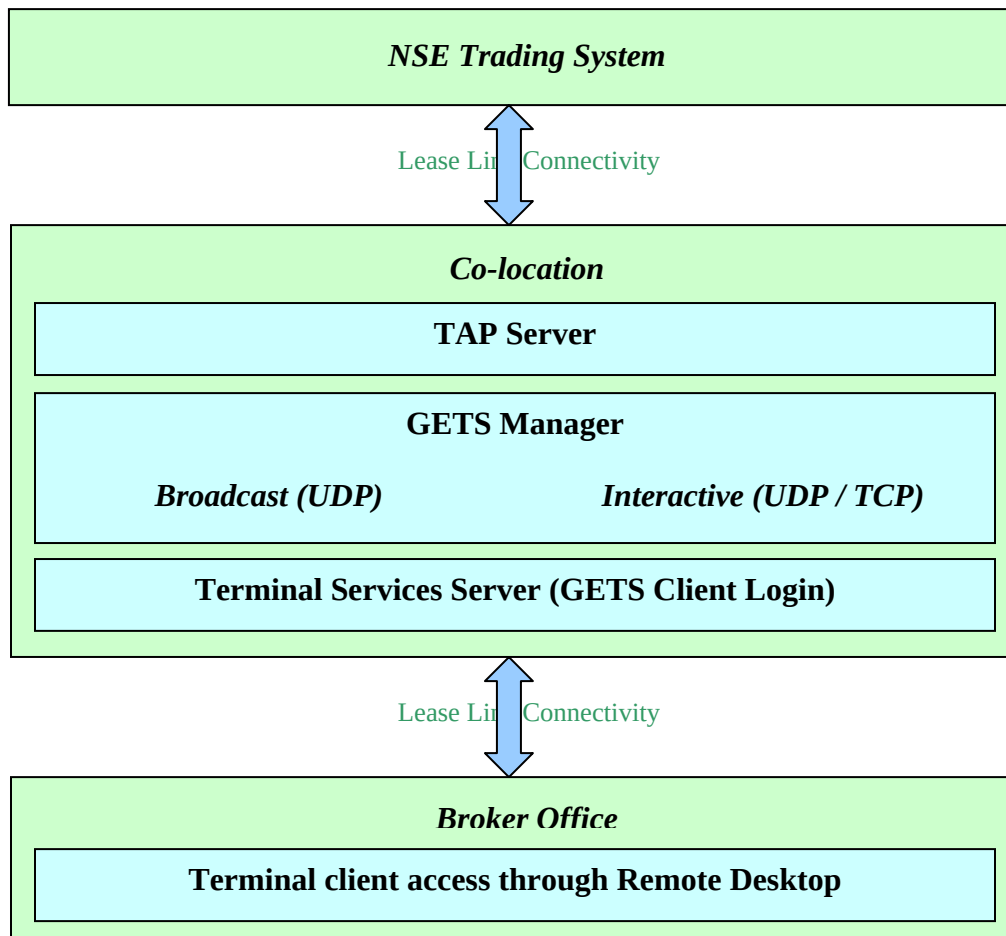

Co-location services are offered by exchanges for ALGO trading. GreekSoft trading system version 2.0 (GMX) supports the co-location services and all automated products can be operated in co-location. All automated modules operate from manager side.

GETS can be operated in NSE co-location in two ways.

- Using Terminal Services
- Using Direct Connectivity

Using Terminal Services

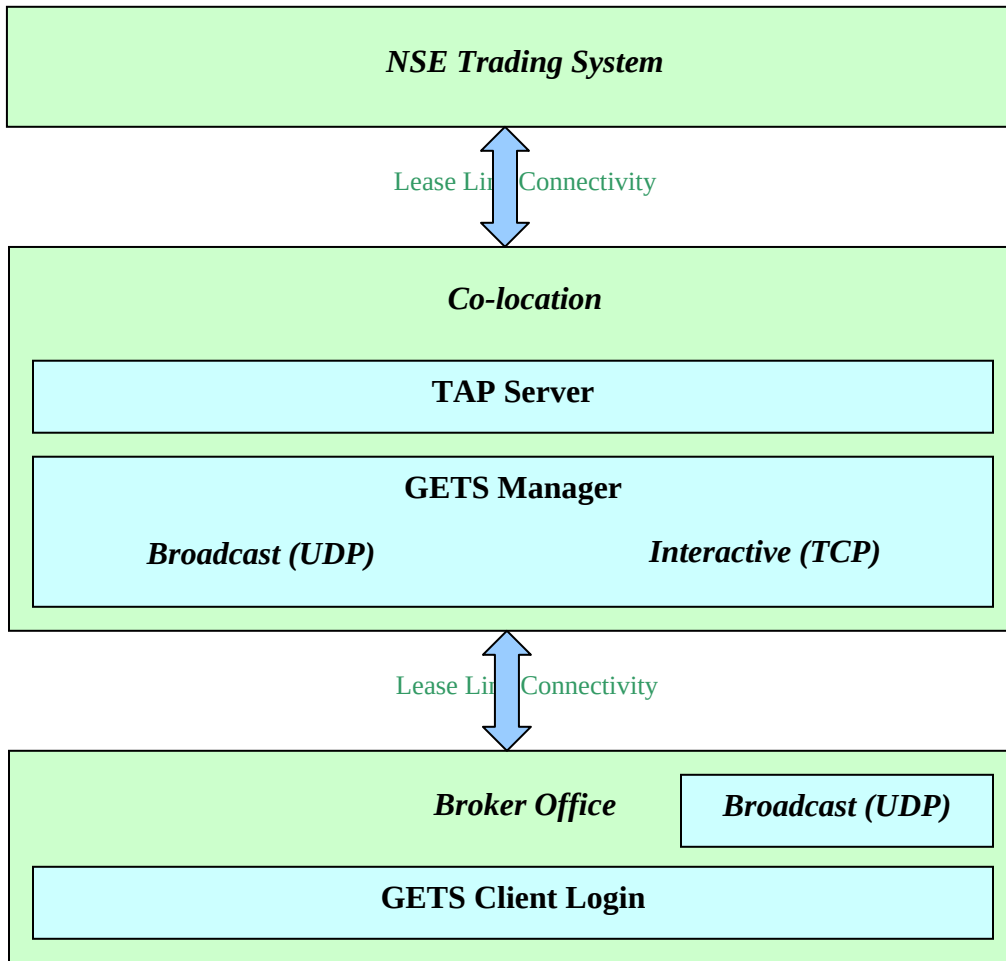

In case of terminal services the operating architecture looks as depicted below.

In co-location services, client will be started in co-location premises with interactive connection (either UDP or TCP) and broadcast (UDP) connectivity from GETS Manager.

Using Direct Connectivity

In case of direct connectivity the operating architecture looks as depicted below.

The client will be started in broker's premises with interactive connection (TCP) to the GETS Manager located at co-location and broadcast will be subscribed to local NSE multicast (UDP). The broadcast setting on manager 'Send to client' must be NO.

Note: The order gateway for BSE has to be added at Broker's office to route the orders of co-location users.
